

ABSTRACT

A liquid crystal display device of the present invention comprises a liquid crystal display panel (1) provided with one or more electrode terminals (R₁) to (R_n) and a pair of reference markers (N1) on a non-display region (3) thereof, a flexible printed circuit board (FPC1) provided with alignment markers (M2) corresponding to the reference markers, and a printed circuit board (PCB1) having one or more electrode terminals (T₁) to (T_n), the reference markers being located inward relative to the alignment markers and the electrode terminals of the liquid crystal display panel and the electrode terminals of the printed circuit board being connected to each other through wiring (P1) to (P_n) of the flexible printed circuit board, wherein the alignment markers are elongated holes having long axes at least in one direction.
